Lab1 Part2

1. Making the original key attributes mandatory, which means that in that case, no matter when the tuples are entered in the entity Result, the original key attributes Patient and Test must be also entered.

2. Setting up the referential integrity for the original key attributes, which means no matter when the original key attributes are entered, the values in the related parent entities must be good valid values.

3. The combination of the original key attributes should be unique. The unique indexes can be created on the combination of the original key attributes to enforce the data integrity.
